IDENTIFIERS	*DIPOV Index

ABSTRACT

This document presents statistical data on United States children and discusses the DIPOV Index, a set of indicators developed by the Center for Social Research, City University of New York, that might be used to describe "the state of the child" in the nation. DIPOV is an acronym for five intercorrelated factors related to an underlying dimension termed "disorganized poverty": (1) Dependency (proportion of children under 18 in families receiving Aid to Families with Dependent Children (AFDC); (2) Incomplete families; (3) Premature births; (4) Out-of-wedlock births; (5) Venereal disease, juvenile. The DIPOV Index was developed in order to provide a detailed picture of the social state of the nation and its political-geographical subdivisions as an aid to determining what social tasks need doing and where they need to be done. The bulk of this report contains data from all counties of all states where information is available on the following: population, percent white population, percent of population less than 18 years old, median income, percent of families below the poverty line, infant mortality rate, physician rate, homicide rate, and the five factors represented in the DIPOV Index. THE STATE OF THE CHILD: NATIONAL PERSPECTIVES
DIPOV INDICES AND RELATED INDICATORS OF CHILD HEALTH AND WELFARE FOR EACH STATE AND COUNTY OF THE UNITED STATES, 1970 - 1972

I. BACKGROUND

If we are to determine what social tasks need doing and where they need to be done, it is necessary to have a detailed picture of the social state of the nation and of its politico-geographical subdivisions. Variables or sets of variables which can be measured repeatedly over time and are reliable (i.e., do not fluctuate inordinately over short periods of time), and which are socially important and normative (i.e., range from "bad" to "good" states) can serve potentially as indicators revealing the social state of the nation. If additional criteria are met, such variables may have even greater implications for social policy and program planning. This would be true, for example, if the variables were available and could depict differences in the goodness of circumstances among successively smaller geographical units (e.g., states of the nation, counties of a state, districts of a city), and if they could be demonstrated to reveal social conditions somewhat more general than those which the variables measure directly.

These additional criteria are important since, if they are satisfied, information would be available for a chain of decisions descending from the national level to, potentially, the sub-county or even neighborhood level. Unfortunately, the data for many variables are presently readily available only for regions or states, and other data which are routinely presented at the county level and other small geographic areas are frequently available only on a decennial rather than on an annual basis. If such information were available annually and could be disaggregated so that state data could be used at the national level, county data at the state level, and sub-county data (e.g., by such census divisions as enumeration districts and block groups) at the county level, the ability to make informed policy decisions at all these levels about the allocation of funds and the placement of programs would be strengthened. Of course, such disaggregated data would be useful at each level only to the extent that they differentiate comparable geographical units. Without doubt, some indicators will differentiate at one level but not at others; for example, among states but not among smaller geographical units. In general, the most useful indicators will be those that depict differences at every level. Finally, with regard to these additional criteria, measurement of indicators which are found to be linked to a broader network of problems and needs is more generally useful than measurement of indicators which are narrower in scope. Indicators which can serve as surrogates for a relatively large set of problems and needs should ordinarily be preferred to indicators which represent only themselves. However, it should be added that it may be necessary to measure a narrow indicator also if it uniquely provides a piece of critical information.

Indicators which meet the qualifications mentioned above, and therefore possess considerable descriptive power, can point to the existence of social problems and needs and can provide information about their comparative incidence and/or prevalence in various politico-geographical units. Such information would constitute useful input to decisions concerning the allocation of resources and the placement of programs and services, while, at the same time, they could also serve to define baselines against which program impact may be judged.[1]

Indicators of Child Health and Welfare

For several years the Center for Social Research of the City University of New York has been engaged in an attempt to develop a set of indicators that would describe "the state of the child." The condition of the nation's children, of course, is an extremely important aspect of the social state of the nation. It is critical to have indicators that will permit monitoring of the physical health and the social, emotional, and cognitive functioning of children, as well as associated phenomena such as the scope and quality of programs of child care.

Some data relevant to these concerns are available from many sources, in many forms.[2] For example, data concerning children are provided by the Census Bureau, by the Health Interview Surveys and Health Examination Surveys of the Public Health Service, by the National Assessment of Educational Progress of the Education Commission of the States, and by many state, county and city agencies, but there have been few systematic attempts to draw together data from many such sources and explore the relationships among the data.

[2] For an overall compilation of national data on children see: Snapper, K. et al. The status of children 1975. Washington, D.C.: George Washington University, 1975.

In our earlier work we employed factor analyses to examine the patterns of relationship among a set of child-related variables separately for two time periods (1960 and 1970) and three sets of geographical units (the 50 states of the United States plus the District of Columbia, the 62 counties of New York State, and the 62 community districts of New York City)[3]. One major aim of this study was to identify the variables which were highly related in all six data sets and that, therefore, seemed to describe the state of children reliably both over time and across sets of geographical units.

The variables included in these analyses were selected with the aid of a schema which attempted to distinguish attributes and characteristics from resources and services, child from context, and health from general welfare (see Table 1). A severe restriction on the selection of variables was the necessity that they be available for the three sets of geographical units. Unfortunately, many potentially valuable variables are not readily available for units smaller than states. In addition to the 25 variables in Table 1, several demographic variables were employed in the analyses to aid in the interpretation of the results. These were White Population, Average Family Size, Divorced Marrieds, Under 18 Population, and Urbanization. Most of the 30 variables were expressed

		Welfare	Crime Index Homicides Public Assistance Recipients Limited Adult Educational Attainment

as rates per unit population.

Of the 25 normative variables, 5 showed high loadings (above a criterion of .60) on the first principal factor[4] in all six independent analyses. We interpreted this first factor to represent an underlying dimension associated with poverty and discrimination since percent white population was always very highly but negatively loaded on the first factor and welfare dependency was also highly loaded. We called this first factor DISORGANIZED POVERTY (describing the negative pole of the factor) and labeled an index, which combined the five highly intercorrelated indicators, the DIPOV Index. The letters in DIPOV form an acronym based on the initial letters of the five indicators: D for Dependency (proportion of children under 18 in families receiving Aid to Families with Dependent Children); I for Incomplete Families (proportion of children under 18 not living with both parents); P for Premature Births (rate of infants with birth weight under 2501 grams per 1000 live births); O for Out-of-Wedlock Births (proportion of live births designated out-of-wedlock); and V for Venereal Disease, Juvenile (usually defined in our data as rate of reported cases of primary or secondary syphilis or gonorrhea among persons under age 20 per 100,000 population under age 20).

---

[4] A first principal factor is an underlying dimension which accounts maximally for common variance among a set of variables. For general discussion of factor analytic procedures see: Harman, H. Modern factor analysis. Chicago: University of Chicago Press, 1967. Principal factor analysis with iteration for communalities was used in all analyses. See: Buhler, R. P-Stat. A computing system for file manipulation and statistical analysis of social science data. Princeton: Princeton University Computation Center, 1974.

It appeared to us that the DIPOV Index might serve as a first approximation for the representation of "quality of child life" for designated geographical areas. We suggested that relative standing on this index is a measure of the goodness of circumstances concerning children in these geographical subdivisions. For example, a state, county or city district with high rates of AFDC children, children in incomplete families, premature births, out-of-wedlock births, and juvenile venereal disease can certainly be considered an area with substantial problems for children and persons interested in children.

II. THE PRESENT STUDY

The DIPOV Index can be further examined in a number of ways to explore its utility. We have chosen two directions. One, represented in this report, extends the factor analyses previously mentioned to the counties of a large number of states in each of three years in order to analyze further the generality of the DIPOV cluster. The second approach, described in a concurrent report,[5] employs sample surveys in two contrasting New York State counties in order to determine the relationship between DIPOV Indices and a substantial number of child, parental and family characteristics and behaviors.

States and Counties of the United States: Factor Analyses

To explore the generality of the DIPOV cluster, which was identified in analyses of 1960 and 1970 data for the states of the United States, the counties of New York State and the community districts of New York City, data were collected for 1970, 1971 and 1972 for all the over 3000 counties of the United States. It was not practical to obtain data for all of the 30 variables employed in the initial study, so a smaller set was chosen. In addition to the five DIPOV indicators, seven other variables were included: infant mortality rate, homicide rate, median family income, percent families with income below the poverty level, rate of practicing physicians, percent population under age 18, and percent white population.

---

[5] Kogan, L. S., Smith, J., and Jordan, L. A. Children and their families in two counties of New York State: An exploration of the ecological utility of the DIPOV Index. New York: Center for Social Research, City University of New York, April 1976.

A large portion of these data was collected through communication with the relevant agencies in each state. In general it was an extremely laborious procedure and in some cases special data runs were performed by the state agencies. Even so, juvenile venereal disease, one of the DIPOV indicators, had to be estimated in many cases. Relatively few states tabulate venereal disease data in the form we required: primary and secondary syphilis and gonorrhea for persons under 20 by county. In many states all stages of syphilis were aggregated for each county and an estimate for the stages of syphilis we required was obtained by use of statewide totals which tabulated the stages separately. In other states venereal disease was not disaggregated by age for the counties and, again, statewide totals by age had to be used to obtain estimates for counties.

Ultimately the data set was better than 95% complete but, clearly, an agency better prepared to collect such data on a routine basis could do so with a shorter time lag to analysis and publication. To achieve this level of completeness, probably a minimum lag of about a year is to be expected.

All states containing at least 50 counties were included in the factor analyses. The factor analytic procedure was identical to the one employed in our earlier analyses. Separate analyses were done for 1970, 1971, and 1972 for each of the selected states. However, if any of the 12 variables was missing for all the counties of a state in a given year, that particular analysis was not performed. This occurred in the following instances: California-1970; Florida-1972; Nebraska-1970, 1971, 1972; North Dakota-1971; Oklahoma-1972; Pennsylvania-1970, 1971, 1972; Virginia-1970, 1971, 1972; Wisconsin-1970, 1971, 1972. In order to eliminate relatively unreliable data, only counties with at least a population of 4000 and 100 live births were included in the analyses that were performed. Five of the variables (family income, incomplete families, families with income below the poverty level, population under age 18, and white population) are derived from census data and, therefore, were available only for 1970. For these variables 1970 data were used in the 1971 and 1972 factor analyses. As an example , the results of one of the factor analyses (Ohio-1970) is presented in Table 2. The loading of each of the variables on each of the three extracted factors appears in this table.

As a summary of all the factor analyses Table 3 indicates, for each of the 26 states included in the factor analyses, which of the five DIFOV indicators met a criterion of .50 as a minimal loading on the first principal factor in each of the three successive years. The states are also grouped into regions since there appear to be possible regional consistencies which deserve note. A more complete presentation of loadings on the first factor in all the analyses appears in Appendix B.

These analyses demonstrate that the DIO indicators (Dependency, Incomplete Families, Out-of-Wedlock Births) form a highly intercorrelated cluster in the first factor. These three indicators, sometimes joined by others, appear together in 63 of the 74 data sets, and of the 11 exceptions, 6 occur in Kentucky and West Virginia. These two states, in fact, depart from all of the others in the nature of their first factor.

*Factor loadings of .50 or greater meet our criterion as high loadings in these analyses.

**One or more of the 12 variables missing for this year.

In every other state percent white population has a high loading in the negative direction on the first factor, as it did in our earlier analyses. This is not true of Kentucky or West Virginia where the first factor essentially seems to reflect poverty alone, rather than a combination of poverty and discrimination. Poverty in these states of Appalachia appears to be both white and black poverty. It is the second factor in both of these states that shows the expected relationship to percent white population. In Kentucky for each of the three years, the IOV indicators have high loadings on the second factor, and in West Virginia the pattern is: 1970-OP, 1971-V, 1972-OV. It would be reasonable in these two states either to combine the first and second factors or to employ the second factor in place of the first factor, even though it accounts for less common variance, since the second factor is related to percent white population and in general loads more of the DIPOV indicators.

The remaining indicators, P and V (Premature Births and Juvenile Venereal Disease), are not consistently highly correlated with the other DIPOV indicators when all states are considered together.

The states of Regions III, IV, and VI, which we can label as southern, southwestern and border states, almost never exhibit V in the first factor. (The exceptions are Tennessee in 1972 and Kentucky and West Virginia in five of the six data sets, if in these two special instances, the second factor is used). On the other hand, the states of Regions II, V, VII, VIII, and IX, which we can grossly label as non-southern states, almost always show V in the first factor. (There are only 5 exceptions in 40 data sets). V, therefore, is rather consistently highly correlated with DIO in some regions of the country.

It might be useful to explore the general absence of V in the first factor in the southern, southwestern, and border states. In every one of these states that lacks V in the first factor, excepting Arkansas, V appears with a high loading on the second factor. In these cases high juvenile venereal disease rates occur in counties which have high median family incomes or high physician rates or both. These appear in general to be the urban counties, and the two most probable reasons for this are either that the youth of rural counties in these states have a lower incidence of venereal disease or that they do not obtain medical care and, therefore, the disease is not reported. The data do not permit us to distinguish between those two possibilities or to evaluate other possibilities.

The P indicator is seldom associated with the other components of DIPOV. It appears in the first factor in only 14 of the 74 data sets. Once again, however, there is a sectional pattern. P very seldom appears in the southern, southwestern and border states (in 4 of the 34 data sets) and it never appears in Regions VII and VIII, which are essentially composed of the plains and mountain states. In Regions II, V, and IX, which we can label as midwestern, midatlantic and western states and which contain many of the large urban centers, P appears in 10 of the 20 data sets. It seems that Premature Births tends to be highly intercorrelated with the other DIPOV indicators when it shows marked variation among the geographical units. In large part, such high contrasts were provided in the earlier analyses by southern against northern states, counties within New York City against upstate counties, and certain extreme community districts in the Bronx, Brooklyn and Manhattan against others which are principally located in Queens and Staten Island. In the present analyses, the non-southern states with counties in large urban centers are those which generally show P as part of the cluster (e.g., California, Illinois, Michigan, Ohio as well as New York).

States and Counties of the United States: Data and DIPOV Indices

Appendix A contains the data we have collected for all states and counties of the United States. In addition to the 12 variables mentioned above, the tables provide the population of each geographical unit and the DIPOV Indices for each unit. The DIPOV Indices can be used to compare counties or states in terms of their relative standing on a composite of the five DIPOV indicators. The notes preceding the tables in Appendix A describe how the Indices were calculated and provide additional information about the variables contained in the tables.

III. SUMMARY

Our attempt to develop a set of indicators that might be used to describe the state of the child resulted, in our earlier work, in the identification of a highly intercorrelated cluster of five variables: Dependency, Incomplete Families, Premature Births, Out-of-Wedlock Births, Venereal Disease, Juvenile. These five indicators accounted for a substantial proportion of the variance common to 25 indicators and their high relationship was demonstrated to be reliable over time (1960 and 1970) and across sets of geographical units (states of the United States, counties of New York State, community districts of New York City). We suggested that the principal factor or underlying dimension of which these five indicators are manifestations is associated (at its negative pole) with poverty and discrimination and we offered an index, which combines these five indicators (the DIPOV or Disorganized Poverty Index),as a gross approximation to the state of child health and welfare in specified geographical areas.

One outcome of the present study is the provision of DIPOV Indices and data on the DIPOV indicators and several associated variables for the 50 states and the over 3000 counties of the United States for 1970, 1971 and 1972. We believe this kind of information may be useful at national, state and county levels in decision-making concerning fund allocation and program placement relative to the needs and problems of children.

Another aspect of the present study is a more extensive test of the generality of the DIPOV indicators as a unitary cluster. Data for the counties within 26 states were separately factor analyzed for 1970, 1971 and 1972. The results suggest some limitations on the universality of the DIPOV cluster as applied to comparison of counties within states. In general the five indicator DIPOV Index appears to be usable without modification primarily for the counties in non-southern states with large urban centers. The counties of non-southern states generally show a DIOV cluster and the counties of the southern states, a DIO cluster. In the latter two areas of the country the reduced indices based on DIOV or DIO might better be employed as an approach for depicting the comparative "state of the child" in designated counties. On the whole, however, it may probably be assumed that the original DIPOV Index is adequate for the purpose of comparing counties within a state.

Notes to APPENDIX A

Year:	Data are presented for 1970, 1971, and 1972, when available.
Population:	Counts of population for 1970. Source: Series PC(1)-B, U. S. Bureau of the Census.
Percent White Population:	Percent of the population designated "white." Source: Series PC(1)-B, U. S. Bureau of the Census.
Percent Population Less Than 18 Years:	Percent of the population under age 18. Source: Series PC(1)-B, U. S. Bureau of the Census.
Median Income:	Median family income for 1969. Source: Series PC(1)-C, U. S. Bureau of the Census.
Percent Families Below Poverty Line:	Percent of families with income below poverty level. Source: Series PC(1)-C, U. S. Bureau of the Census.
DIPOV Index 1:	Each county DIPOV Index is a mean standard score based on the standard scores of five variables: Percent Children Less Than 18 Years in AFDC, Percent Children Less Than 18 in Incomplete Families, Premature Birth Rate, Percent Out-of-Wedlock Births, Juvenile V.D. Rate. The standard scores for each variable are based on the mean and standard deviation of all the counties nationwide. State DIPOV Indices are means of the county DIPOV Indices, weighted by the county populations. This index is presented only for 1970 since one of the variables (Percent Children Less than 18 in Incomplete Families) was not available for 1971 or 1972 for any of the counties or states. In those instances when fewer than five variables were available, the index was based on those available. An index is flagged with an "*" when it is judged relatively unreliable because the population was less than 5,000, the number of live births was less than 300, or fewer than three variables were available. High positive DIPOV Indices indicate an unfavorable status since this reflects a greater proportion of children in AFDC, etc. Conversely, high negative DIPOV Indices indicate a favorable status.

DIPOV Index 2:	The mean standard score based on the standard scores of four variables, just as for Index 1 but omitting Percent Children Less Than 18 in Incomplete Families. This variable is available only for 1970, so the 1970 DIPOV Index 2 is more closely comparable to the 1971 and 1972 indices than Index 1 would be. If fewer than four variables were available, the index was based on those available. An Index is flagged with an"*" when it is judged relatively unreliable because the population was less than 5,000, the number of live births was less than 300, or fewer than three variables were available.
Percent Children Less Than 18 Years in AFDC:	Percent of children under 18 years of age in families receiving Aid to Families with Dependent Children. Source: NCSS Report A-8, National Center for Social Statistics, U. S. Department of Health, Education, and Welfare.
Percent Children Less Than 18 in Incomplete Families:	Percent of children under 18 years of age living in one-parent families. Source: Series PC(1)-C, U. S. Bureau of the Census.
Premature Birth Rate:	Rate per 1,000 of infants with birthweight under 2,501 grams based on resident live births. Source: Correspondence with the individual states.
Percent Out-of-Wedlock Births:	Percent of resident live births that were designated out-of-wedlock. Source: Correspondence with the individual states.
Juvenile V.D. Rate:	Rate per 100,000 of persons under 20 years of age reported as cases of primary syphilis, secondary syphilis or gonorrhea based on total population under 20 years of age. Source: Correspondence with the individual states.
Infant Mortality Rate:	Rate per 1,000 of resident deaths under one year of age based on resident live births. Source: Correspondence with the individual states.
Physician Rate:	Rate per 100,000 of non-federal physicians in office-based private practice based on population. Source: The annual publication (1970, 1971, 1972): Distribution of Physicians in the United States, American Medical Association.
Homicide Rate:	Rate per 100,000 of homicides based on population. Source: Correspondence with the individual states.
